Instructions and Explanation of assignment.

1. Design and develop a page for the adding multiple products/items information. If you follow the above design there is a row holding multiple input fields (Image, Title, Description, Quantity, Date etc..) corresponding to the row there is a **"+"** button for adding another row on the page. So user can create multiple rows as per the need.
2. After filling the detail in the input field, user can press the save button to submit the information and store them to the database.
3. After that you can develop another page for listing the products/items information, the listing should have features to filter the items by date range, title etc.

Note: JQUERY data table will not be considered for the list, you need to design your own table for listing.

1. List should have pagination with 10 items in a single page.
2. Need to provide a filter option on the table to filter records on the basis of title and date range.
3. Apply an appropriate validation on all input fields.
4. Description field should not allow more than 250 characters.
